

AzureDevops: How to Connect Azure DevOps with GitHub

Connecting Azure DevOps with GitHub involves setting up a connection that allows you to integrate your GitHub repository with Azure DevOps services, such as Azure Pipelines for CI/CD.

Here's a step-by-step guide on how to connect Azure DevOps with GitHub:

1. Create a New Project in Azure DevOps

We sign in to your Azure DevOps account

We navigate to the Azure DevOps portal and we create a new project if you haven't done so already

We provide a name and description for your project

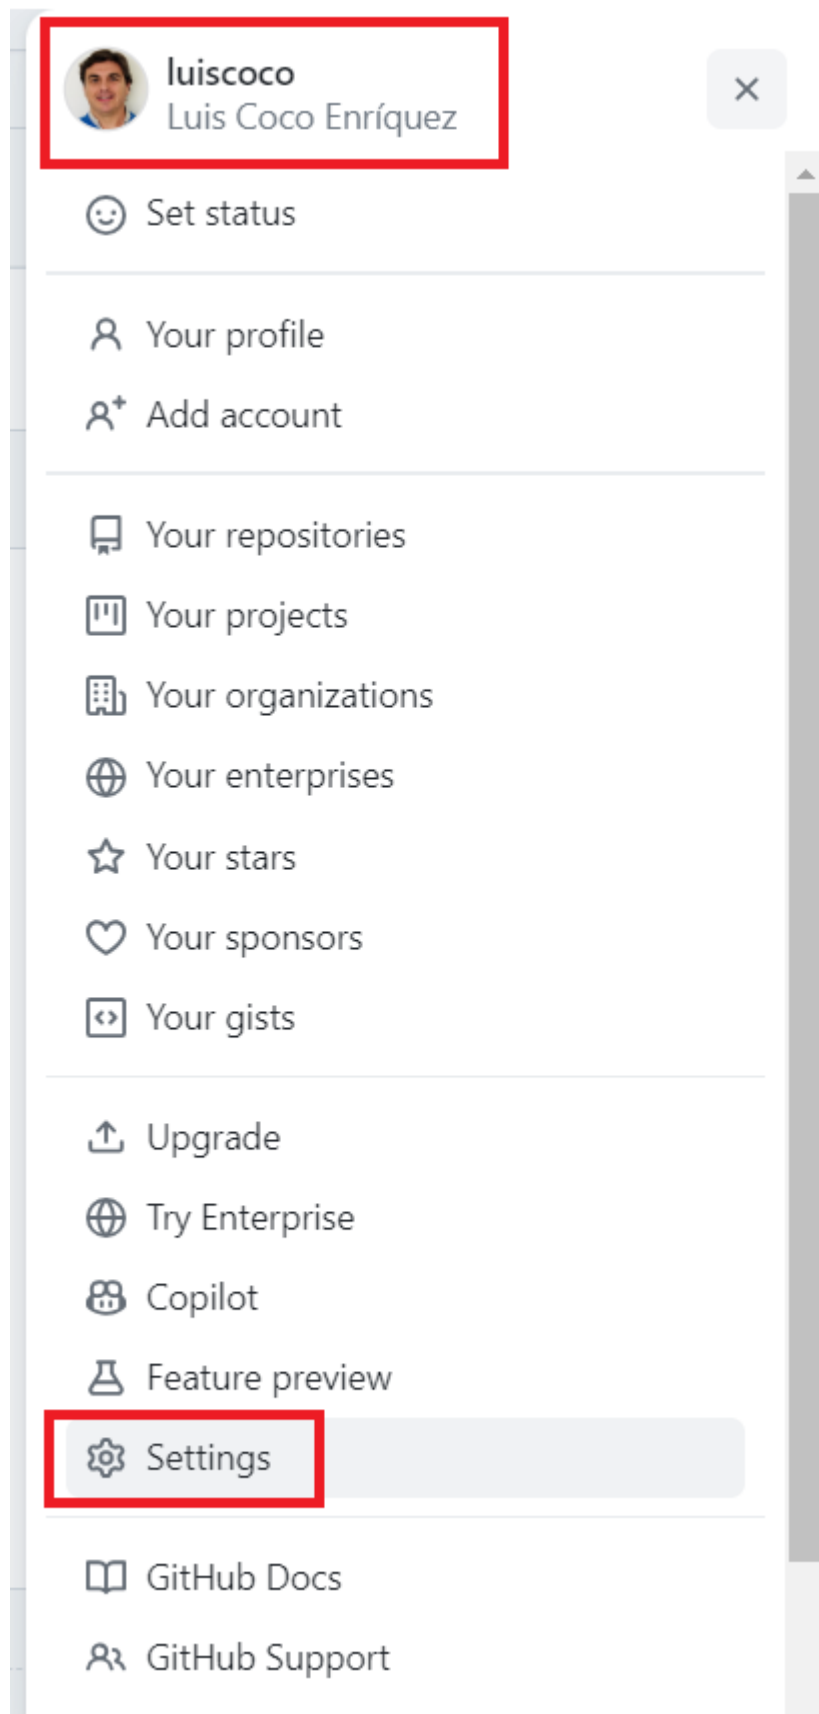

2. Generate GitHub Personal Access Token (PAT)

We go to GitHub and **sign in**

We click on your **profile icon** in the top right corner

We select the **Settings** option

From the sidebar, we select **Developer settings** -> **Personal access tokens**

Archives

 Security log Sponsorship log

<> Developer settings

We click on Generate new token.

 GitHub Apps OAuth Apps Personal access tokens

Fine-grained tokens

Beta

Tokens (classic)

We give your token a descriptive name, select the scopes or permissions you want to grant this token (for Azure DevOps, select repo, admin:repo_hook), and then click Generate token

The screenshot shows the GitHub Developer Settings page. The left sidebar has a menu with 'GitHub Apps', 'OAuth Apps', 'Personal access tokens', 'Fine-grained tokens', and 'Tokens (classic)'. The 'Personal access tokens (classic)' option is selected. The main content area shows a list of generated tokens. A dropdown menu is open for the 'Generate new token' button, showing two options: 'Generate new token (Beta)' and 'Generate new token (classic)'. The 'Generate new token (classic)' option is selected. Below the dropdown, there is a table of generated tokens. The first token is named 'With GH Actions' and has the scope 'repo, workflow'. The second token is named 'Eclipse token' and has the scope 'delete_repo, project, repo'. The page footer contains the GitHub logo, copyright information, and links to Terms, Privacy, Security, Status, Docs, Contact, Manage cookies, and Do not share my personal information.

3. Connect Azure DevOps to GitHub

3.1. Using Azure Pipelines

In Azure DevOps, we go to your project and we select **Pipelines** from the left navigation panel

We click on **Create Pipeline**

dev.azure.com/luiscoenriquez0130/mysecondproject/_build

En pausa

Azure Pipelines
Installed 7 months ago
Developed by [AzurePipelines](#)
<https://azure.microsoft.com/services/devops/pipelines/>

Continuously build, test, and deploy to any platform and cloud

[Azure Pipelines](#) offers cloud-hosted pipelines for Linux, macOS, and Windows with 10 free parallel jobs and unlimited minutes for open source projects.

Any language, platform, and cloud
Build, test, and deploy Node.js, Python, Java, PHP, Ruby, Go, C/C++, C#, Android, and iOS apps. Run in parallel on Linux, macOS, and Windows. Deploy to cloud providers like Azure, AWS, and GCP. Distribute mobile apps through beta channels and app stores.

Native container support
Create new containers with ease and push them to any registry. Deploy containers to independent hosts or Kubernetes.

Advanced workflows and features
Easy build chaining and multi-phased builds. Support for YAML, test integration, release gates, reporting, and more.

Extensible
Use a range of build, test, and deployment tasks built by the community – hundreds of extensions from Slack to SonarCloud. You can even deploy from other CI systems, like Jenkins. Webhooks and REST APIs help you integrate.

We scroll down and select the repo and press the button **Approve and Install**

The screenshot shows the GitHub repository settings page for a repository. The left sidebar contains navigation links: Copilot, Pages, Saved replies, Security, Code security and analysis, Integrations (highlighted), Applications (highlighted), Scheduled reminders, Archives, Security log, Sponsorship log, and Developer settings. The main content area is titled 'permissions' and shows two permissions: 'Read access to metadata' and 'Read and write access to checks, code, commit statuses, deployments, issues, and pull requests'. Below this is the 'Repository access' section, which is highlighted with a red box. It contains a yellow box stating 'Azure Pipelines suggested installation on the following repositories.' and two radio button options: 'All repositories' and 'Only select repositories' (selected). The 'Only select repositories' option is also highlighted with a red box. Below it is a 'Select repositories' button. A list of selected repositories is shown, with 'luiscoco/Books_API (suggested)' highlighted by a red box. At the bottom are 'Approve and install' and 'Cancel' buttons.

  with:
    name: published-app
    path: ./publish
```

3.2. Service Connection Method

We go to **Project settings** in the bottom left corner of your Azure DevOps project

Under **Pipelines**, we select **Service connections**

We click on **New service connection** and choose **GitHub**

We choose **GitHub** via **Personal Access Token (PAT)**, we enter the PAT you generated earlier, and we give your connection a name

New service connection

- ☐  Docker Host
- ☐  Docker Registry
- ☐  Generic
- ☒  GitHub
- ☐  GitHub Enterprise Server
- ☐  Incoming WebHook
- ☐  Jenkins
- ☐  Jira
- ☐  Kubernetes
- ☐  Maven
- ☐  NuGet
